LETTER 01-07 "Revised Adamski Concept"
See "jjb23 Sketch

Pg. 01

Kim, I have been experimenting with resonating magnetized spheres attached to a magnetic pole.

The sphere has a small gap that wind from the flange rushes through and out a small port on top of the flange.

The sphere is set into resonance by the sudden changes in flow velocity. The sphere therefore rises and falls producing an anti-gravity force on the ship caused by the flange's 130% drag down and 30% drag up aerodynamics.

The sphere resonates pyro-magnetically and has a change in its field intensity as the gap resonantly gets smaller and compresses air.

The spheres mechanical and magnetic oscillation drive the ships power coil seen in yellow at the top and induces a strong updraft to maintain the spheres oscillation.

By damping one spheres oscillation over another directional travel is possible.

This design is tested and has shown remarkable anti-gravity effects as well as high power levels.
