LETTER 12/04 "Barium Titanate & Electro-gravitics"

Pg. 01

Kim, There is a good Barium Titanate experiment in "Physics Demonstration Experiments" volume one & two.

It is found right after the Tesla coil demonstration page.

Barium Titanate has the highest dielectric constant known to man. Its wonderful stuff. Ultra pure water "ALSO" has a very high dielectric constant.

I am on the threshold of reproducing Keely's original air ship. I have made a discovery in a plate resonator design that allows a self sustaining wind to be produced in an organ pipe.

If I am correct we can reproduce Keely's original air ship without using electromagnetism or Schauberger disc's.

All we would need to throttle the flexible plate resonator is a simple key board valve. The plates oscillate in a flagging configuration and "DO NOT ROTATE".

The absence of rotation gives us a much simpler fabrication problem.

Keely was the grandfather of implosion technology. I will send you details if my design begins to self sustain its resonance without an internal or external wind input.

Kim remember the MHD generator the air force uses or "FLAME JET GENERATOR" is well known to me. It requires combustion. We have a "NO FUEL" research effort.MHD generators also require cesium dopants to increase flame ionization or the efficiency is too low. MHD has a lot of technical problems.

The thermodynamic energy in the wind is what the military is hiding from the public. Magneto hydrodynamic generators need a gas jet with a powerful magnetic field. WE ARE AFTER A THERMODYNAMIC WIND EFFECT. The fuel based technology is well known in physics circles. Still your ideas are very interesting. We might need a Billion dollar research budget to finish some of them.Keely built his non-fuel based resonant air ship for far less then that.Electro-gravitics is far easier to do if you have a powerful generator. We need to perfect the Repulsine plates and the elector-gravitics will solve itself.
THANK YOU end
