**LETTER 8/04 "Rotating Exhaust Band Machines"**  
See jjb21

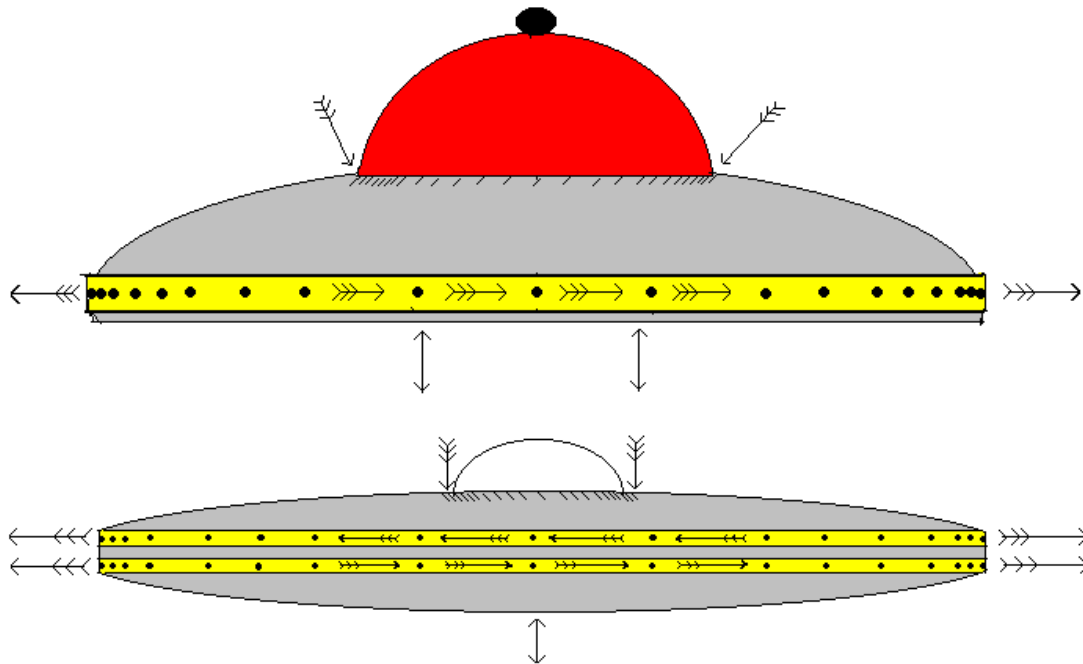

Pg. 01

Kim, this class of UFO has a rim mounted rotating exhaust band.

One machine has only a "SINGLE" rotating exhaust band. It is usually a bright yellow, indicating extreme heat.

The bottom machine has "TWO COUNTER-ROTATING" exhaust bands.

The purpose of placing a rotating band at the rim of the machine is to prevent the exhaust from spinning the entire hull of the ship.

The exhaust band supports a powerful updraft against the bottom of the ship that powers it from resonance and heat.

The exhaust is always directed straight out from the rim of the ship and never downward.

Page 2

The convection current striking the bottom of the hull must not be interfered with by the rim exhaust.

These designs have been seen hundreds of times around the world.

The rotating exhaust band is one of the most common methods for expelling exhaust from a UFO's hull. Rotating a large hull has many gyroscopic forces that are minimized by the use of an exhaust band.
